ENVE TUBELESS TAPE GUN INSTRUCTIONS

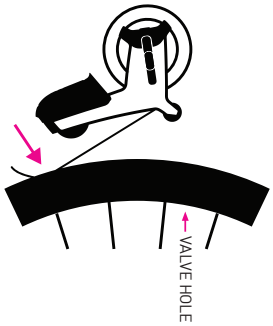

The ENVE Tubeless Tape Gun is designed to work with all tubeless tape brands whose tape features a 75mm/3in core with widths between 25mm and 40mm.

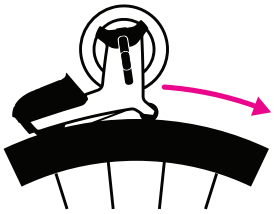

1. Ensure old tape and all adhesive residue is removed by cleaning rim channel with isopropyl alcohol. Pull side lever up to load tape roll. The tape will self-center on the tool.

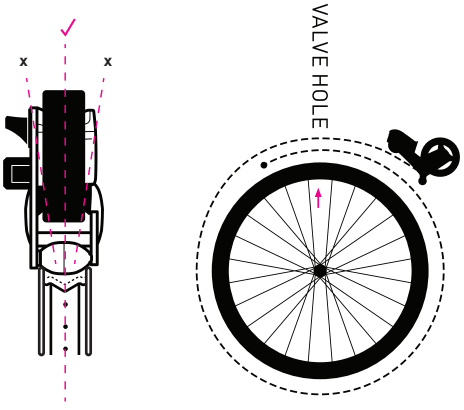

2. Pull the tape over the bar with the adhesive side out.

3. Press the end of the tape firmly into the center of the rim channel. Start 2-3 spoke holes from the valve.

4. Ensure the end of the tape is adhered and held in place, as you push the tool forward along the rim.

5. Keep the tool parallel to the rim as you tape around the rim. Overlap the tape by 2-3 spoke holes to complete.

6. Tip the tool back (wheelie) on the red bar to reveal the cutting tool. Push forward to cut the tape. Finish with the valve installation.
